

# BLACK DOT/RED DOT SIGHT

EXCLUSIVE NAYVIS™ TECHNOLOGY DELIVERS HIGH PERFORMANCE UNDER ALL LIGHTING CONDITIONS!

The PK-AS is one of the best optical device produced for the Kalashnikov rifle and its hunting clones sold under SAIGA brand. Much more than just a see-through tubular red dot sight, it is actually an advanced 1x "scope" with an exotic prismatic lens system. PK-AS series professional grade Russian combat sights are high end units featuring a state-of-the-art prismatic lens system which delivers an amazing high definition crystal clear "wide angle" field of view. It's special features are tailored for both close-in and long range shooting out to about 400 meters. This unit far out-classes the conventional "tube-type" see-through designs of the competition. Most importantly the "black dot/red dot" system allows the greatest flexibility for superior performance in both sunlight or dark environmental conditions, night or day, by eliminating wash out in bright sunlight. Outstanding daytime precision shooting is no problem, with or without battery power

Pictured on the left is the original PK-AS with the military mounting bracket (low mount with a slight left side offset). On the right is the PK-AS-A variant which uses an "over-the-bore" bracket design. In either case, all versions feature an advanced, well regulated 8-level user selected brightness control, rubber lens cover, super-compact size, and light weight. All sight packages include a field cover in VSR camouflage, original Russian manual.
